# Assignment

1) Node js

Node.js is a Javascript runtime environment that allows you to run Javascript outside the browser (on your computer / server).

Used for:

To run JS on the backend

To build servers and APIs

To manage packages using npm (node Package Manager).

2) React :

React is a JS library used to build user Interfaces (UI), especially for web applications.

It was developed by Meta (facebook)

Key Features:

→ Component-based architecture
→ Fast rendering using Virtual DOM
→ Reusable components
→ Easy to manage UI

3) CRA:

Create React App (CRA) is a tool used to quickly create a React project with no configuration.

cmd:

npx creat-react-app my-app

Features:

* Pre-configured setup (webpack, Babel)
* Easy for begineers
* No Need to configure manally

Drawbacks:

* Slower performance
* Less flexible for advanced customization.
* Larger bundle size.

4) Vite:

Vite is a modern frontend build tool used to create fast React (and other) applications

cmd: npm create vite@latest.

* Features:
  - → Very fast startup
  - → Instant hot reload
  - → Lightweight
  - → Uses modern ES modules
