7/4/26

1) What is JSON.stringify()?

JSON.stringify is used to converts JavaScript Object → string.

Because localStorage can only store strings, not objects.

Example:

```
let user = {
        Subject: React,
        class : 1 month
    };
let data = JSON.stringify(user);
 console.log (data);
```

o/p:

'{"Subject": "React", "class": "1month"}'

2) What is JSON.parse()

It converts string → JavaScript object

Example:

```
let data = {"Subject : React"};
 let user = JSON.parse (data);
 console.log (user.name);
```

o/p:

// React

3) local Storage with functions:

Local Storage is used to store data in browser permanently.

Data stays even after refresh or browser close.

* setItem() → Store data

```
localStorage.setItem("subj", "React");
```

* getItem() → Get data

```
let subj = localStorage.getItem("subj");
console.log(subj);
```

* removeItem() → Remove specific data

```
localStorage.removeItem("subj");
```

* Clear() → Remove all data

```
localStorage.clear();
```

4) Cookies:

* Small data stored in browser
* Sent to server with every request
* Has expiry time

Session Storage:

* Data stored only for one tab.
* Deleted when tab is closed
* Local storage and session storage has same structure.

Local Storage:

* Data stored permanently
* Not sent to server
* Stays until manually deleted

Feature	LocalStorage	SessionStorage	Cookies
Storage size	~5MB	~5MB	~4KB (very small)
Expiry	No expiry	Tab close	Can set expiry
Server Access	No	No	Yes
